

Cellular Automata - So Far

elementary cellular automaton

- ▶ 1D array of cells
- ▶ 2 states
- ▶ update based on state of cell and immediate neighbors
- ▶ 8 possible updates
- ▶ 2^8 possible rules

behavioral classes of cellular automata

- ▶ class 1: quick evolution to homogeneous state, information is destroyed quickly
- ▶ class 2: reaches stable state quickly, information may be preserved, local changes remain local
- ▶ class 3: pseudo-random or chaotic evolution, information destroyed, local changes spread
- ▶ class 4: complex patterns evolve, structures may survive a long time

Rule 110

- ▶ elementary cellular automaton
- ▶ capable of universal computation

Conway's Game of Life

- ▶ totalistic rules (depends only on number of neighbors)
- ▶ capable of self-replication
- ▶ capable of universal computation
- ▶ rule: B3/S23 (birth: 3, survival: 2,3 neighbors)

Social Science Models

- ▶ gossip model - spreading of information, disease
- ▶ majority model - social conformance
- ▶ Schelling model - segregation

Physics / Chemistry Models

- ▶ Greenberg-Hastings model - reaction diffusion (more later)

More on Cellular Automata

Today

- ▶ Hashlife
- ▶ cellular automata and convolutions
- ▶ FFT Life
- ▶ LargerThanLife
- ▶ RealLife
- ▶ SmoothLife
- ▶ PDEs vs Cellular Automata

Today

- ▶ WireWorld
- ▶ Langton's Ant
- ▶ Langton's Loops, Evoloops
- ▶ Lattice Gases

Kinds of Cellular Automata

totalistic:

- ▶ next generation depends only on total number of neighbors

stochastic:

- ▶ finite state → Markov chains, locally interacting markov chains
- ▶ discrete state, stochastic state transitions

asynchronous:

- ▶ updates in regular cellular automata are all parallel, synchronous
- ▶ asynchronous updates tend to destroy structure
- ▶ http://en.wikipedia.org/wiki/Asynchronous_cellular_automaton
- ▶ synchronous behavior can be achieved by extending the cellular automaton

Implementations of Life

Hashlife

- ▶ efficient way of computing large scale, long-term evolution
- ▶ <http://en.wikipedia.org/wiki/Hashlife>
- ▶ <http://www.drdoobs.com/jvm/an-algorithm-for-compressing-space-and-t/184406478>
- ▶ decompose grid in a quad-tree like structure
- ▶ compute hash codes for nodes
- ▶ compute long term evolution for nodes and store it
- ▶ (demo)

Life Generalizations

- ▶ totalistic cellular automata and filtering
- ▶ large area totalistic automata, LargerThanLife, RealLife
- ▶ separable filters
- ▶ FFT and non-separable, smooth filters
- ▶ SmoothLife
- ▶ integro-differential equations

PDEs and Cellular Automata

- ▶ cellular automata can approximate differential equations
- ▶ effectively, simulate numerical solution to PDEs

Reverse:

- ▶ differential equations can simulate cellular automata
- ▶ Omohundro (1983): construction with C^∞ bump functions
- ▶ probably better, more natural constructions possible

Other Cellular Automata

WireWorld

- ▶ simple cellular automaton capable of universal computation
- ▶ rules divide the world into fixed “wires” and “insulators”
- ▶ wire is in one of three states: empty, electron head, electron tail
- ▶ rules are sufficient to build: clock generators, logic gates
- ▶ out of these, entire circuits and processors can be built
- ▶ no self-replication because no wires can be added (but can start out with infinite structure)
- ▶ can built Langton's Ant, Turing-complete wireworld computer

Langton's Ant

- ▶ simple 2D turing machine
- ▶ state: head position, direction
- ▶ transition rules:
 - ▶ at a white square, turn 90° right, flip color, move forward
 - ▶ at a black square, turn 90° left, flip color, move forward
- ▶ complex behavior: simple patterns, then chaos, then “highway”
- ▶ Gajardo (2000): Langton's ant is computationally universal

Self-Reproducing Loops

- ▶ “self-reproduction” was one of the first motivations for cellular automata
- ▶ difficult in Conway’s game of life (easier in some variants)
- ▶ other cellular automata variants make it easier

Langton's Loops

- ▶ 8 state cellular automaton
- ▶ states represent walls, background, information storage in the loop
- ▶ states inside the loop instruct the construction of loop extensions
- ▶ specific instructions result in self-replication

Self-Replicating Loops

- ▶ original: self-replication
- ▶ Byl's loop, Chou-Reggia loop: simpler loops w/o sheaths
- ▶ Perrier loop: self-replication plus Turing completeness
- ▶ Tempesti loop: self-replication plus internal structure
- ▶ SDSR loop: self-replication and death
- ▶ Evoloop: self-replication and mutation, demonstrates evolution
